Key to leveraging Abaqus's full potential are UMATs, UELs, HZG, and DE routines—powerful extensions that enable users to define complex material behaviors, tailor element formulations, and incorporate specialized physics beyond standard library options.

This article provides an in-depth exploration of these user subroutines and features, examining their roles, functionalities, best practices, and how they can elevate your finite element modeling projects.

Understanding Abaqus User Subroutines: An Overview

Abaqus offers a suite of subroutines that allow users to embed custom behaviors into finite element models. These subroutines are essentially user-defined functions written in FORTRAN, integrated into the Abaqus solver to modify or extend its default capabilities.

Key User Subroutines:

- UMAT: User-defined Material Subroutine
- UEL: User-defined Element Subroutine
- HZG: User-defined Heat Generation Subroutine
- DE: User-defined Damping Subroutine

Each serves a specific purpose, providing a flexible interface to incorporate complex material models, custom element behaviors, heat sources, and damping mechanisms.

UMAT: Custom Material Behavior in Abaqus

What is a UMAT?

The UMAT subroutine stands for User Material. It allows users to define material behavior that is not available in Abaqus's standard library. By writing a UMAT, engineers can model sophisticated, nonlinear, rate-dependent, or unconventional materials, including composites, polymers, biological tissues, or innovative alloys.

Core Functionalities of UMAT:

- Specify stress-strain relationships
- Implement complex constitutive laws
- Handle temperature-dependent or time-dependent behaviors
- Incorporate damage and failure models

How UMAT Works

Abaqus calls the UMAT at each material point during the solution process. The UMAT computes the stress tensor based on the strain increment and current state variables, returning updated stresses and material state variables for the next increment.

Typical UMAT Workflow:

- Receive strain increment and other state variables
- Calculate the new stress tensor
- Update internal variables (e.g., damage, hardening parameters)
- Pass these back to Abaqus for the next iteration

Designing an Effective UMAT

- **Programming Precision:** A meticulous implementation of the constitutive model is essential. Errors can lead to convergence issues or inaccurate results.
- **State Variables:** Use them to track history-dependent phenomena like plasticity, damage, or phase transformations.
- **Efficiency:** Optimize code for computational speed, especially for large models.
- **Validation:** Rigorously validate your UMAT against experimental data or benchmark problems.

Advantages and Limitations

Advantages:

- Complete control over material modeling
- Ability to implement novel or proprietary models
- Flexibility to incorporate physics not supported natively

Limitations:

- Requires proficiency in FORTRAN programming
- Complex models may impact computational performance
- Debugging can be challenging without proper tools

UEL: Creating Custom Elements for Specialized Applications

What is a UEL?

UEL stands for User-defined Element. It permits the creation of custom finite elements with user-specified degrees of freedom, interpolation functions, and behaviors. This is particularly valuable when standard elements cannot capture complex physics or geometries.

Use Cases of UEL:

- Modeling sophisticated shell or solid elements with unique interpolation
- Implementing elements for multi-physics problems (e.g., fluid-structure interaction)
- Developing elements for non-standard geometries or anisotropic behaviors

Designing a UEL

Implementing a UEL involves defining the element stiffness matrix, residual vector, and mass matrix, along with shape functions and integration schemes.

Key Steps:

Applications:

- Damping based on deformation or energy
- Damping that varies with frequency or mode shapes
- Incorporating physical damping mechanisms

Implementing DE

The routine computes damping forces or damping matrices based on current state variables, enabling a nuanced control over how damping influences the dynamic response.

Best Practices for DE

Popular Python Scripts for Abaqus: Learn by Example

The community has curated numerous example scripts covering a spectrum of tasks. These scripts serve as invaluable learning tools and starting points for custom automation.

1. Automating Model Creation

A typical example involves creating geometric entities programmatically, such as parts, assemblies, and features.

Example Highlights:

- Creating a 3D block with specific dimensions.
- Adding holes or fillets via scripting.
- Parameterizing dimensions for design optimization.

Sample snippet:

```
```python
```

```
from part import
```

Create a new part

```
part = mdb.models['Model-1'].Part(name='Block', dimensionality=THREE_D,
type=DEFORMABLE_BODY)
```

Sketch rectangle

```
s = part.ConstrainedSketch(name='__profile__', sheetSize=200)
```

```
s.rectangle(point1=(0,0), point2=(100,50))
```

Extrude to create 3D block

```
part.BaseSolidExtrude(sketch=s, depth=50)
```

```
```
```

2. Mesh Generation and Refinement Scripts

Mesh quality directly influences simulation accuracy. Scripts automate meshing strategies, refinement zones, and element types.

Features covered:

- Assigning element types.
- Applying mesh controls.
- Refining mesh in regions of interest.

Sample snippet:

```
```python
```

Assign mesh controls

```
elemType1 = mesh.ElemType(elemCode=C3D8, elemLibrary=STANDARD)
```

```
region = part.sets['EntirePart']
```

```
part.setElementType(regions=(region,), elemTypes=(elemType1,))
```

Generate mesh

```
part.seedPart(size=5.0, deviationFactor=0.1, minSizeFactor=0.1)
```

```
part.generateMesh()
```

```
```
```

3. Applying Boundary Conditions and Loads

Automating the application of boundary conditions saves time and improves repeatability.

Features covered:

- Fixing degrees of freedom.
- Applying forces, pressures, or displacements.

- Using scripts to define complex loading scenarios.

Sample snippet:

```
```python

a = mdb.models['Model-1'].rootAssembly

region = a.instances['Block-1'].sets['Face-1']

mdb.models['Model-1'].DisplacementBC(name='Fix-Left', createStepName='Initial', region=region,
u1=0, u2=0, u3=0)

```
```

4. Automating Job Submission and Monitoring

Batch processing multiple analyses, parametric studies, or optimization routines require scripting job control.

Features covered:

- Defining jobs dynamically.
- Submitting jobs in the background.
- Checking job status programmatically.

Sample snippet:

```
```python

job = mdb.Job(name='AnalysisJob', model='Model-1')

job.submit()

job.waitForCompletion()

```
```

5. Post-Processing Results

Extracting results programmatically enables detailed analysis and report generation.

Features covered:

- Accessing nodal displacements, stresses.
- Creating XY data plots.
- Exporting data to external files.

Sample snippet:

```
```python

odb = session.openOdb(name='AnalysisJob.odb')

step = odb.steps['Step-1']

frame = step.frames[-1]

stress = frame.fieldOutputs['S']

max_stress = stress.getMaximum()

print('Maximum von Mises stress:', max_stress.data)

```
```
