Detailed Breakdown of Typical Questions from May 2012 Paper 2

Sample Question 1: Atomic Structure and Periodic Trends

Question:

Describe how atomic radius varies across a period and down a group in the periodic table. Explain the underlying reasons for these trends.

Sample Answer:

- Atomic radius decreases across a period from left to right.
- This trend occurs because additional protons increase the nuclear charge, pulling electrons closer to the nucleus, despite the electrons being added to the same energy level.
- Atomic radius increases down a group because new electron shells are added, increasing the distance between the nucleus and the outermost electrons.

Sample Question 2: Chemical Bonding

Question:

Explain the difference between ionic and covalent bonding, including their typical properties.

Sample Answer:

- Ionic bonding involves the transfer of electrons from a metal to a non-metal, resulting in oppositely charged ions that attract each other.
- Covalent bonding involves sharing pairs of electrons between non-metal atoms.
- Ionic compounds tend to have high melting points, are brittle, and conduct electricity when molten or dissolved.
- Covalent compounds generally have lower melting points and do not conduct electricity in the solid state.

Sample Question 3: Thermodynamics and Kinetics

Question:

Calculate the enthalpy change for the reaction using bond enthalpies:

Given bond enthalpies (kJ/mol):

- C-H: 412
- C=C: 614
- C=O: 803
- O=O: 498

Answer:

- Break all bonds in reactants:

C-H bonds in ethane: 6 bonds $\times$ 412 = 2472

O=O bonds: 3.5 bonds $\times$ 498 = 1743

- Form bonds in products:

C=O in CO₂: 4 bonds $\times$ 803 = 3212

O-H in H₂O: 6 bonds $\times$ 412 = 2472

- Calculate ΔH :

$\Delta H = (\text{Bonds broken}) - (\text{Bonds formed}) = (2472 + 1743) - (3212 + 2472) = 4215 - 5684 = -1469$ kJ/mol
