engineering surveying solved problems with answer

Engineering surveying is a fundamental discipline within civil engineering that involves measuring and mapping the Earth's surface to aid in the design, construction, and management of infrastructure projects. It plays a crucial role in ensuring that engineering works are accurately positioned, properly aligned, and efficiently executed. However, surveying often presents various practical problems that require precise solutions. In this article, we explore some common engineering surveying problems along with their detailed solutions, offering valuable insights for students, professionals, and enthusiasts in the field.

Common Engineering Surveying Problems and Their Solutions

Surveying problems can range from simple distance measurements to complex three-dimensional coordinate computations. Understanding how to approach and solve these problems is essential for successful project execution. Below are some typical problems encountered in engineering surveying, along with their step-by-step solutions.

1. Calculating Horizontal Distance Using Level and Staff

Problem Statement

Determine the horizontal distance between two points when the measured staff reading at the first point is 1.25 m, at the second point is 2.75 m, with a difference in elevation of 0.50 m, using a dumpy level.

Solution

Given Data:

- Staff reading at point A (R_A): 1.25 m
- Staff reading at point B (R_B): 2.75 m
- Difference in elevation between points A and B (Δh): 0.50 m

Step 1: Find the difference in staff readings:

$$\backslash$$

$$\text{Staff difference} = R_2 - R_1 = 2.75 - 1.25 = 1.50 \text{ m}$$

$$\backslash$$

Step 2: Adjust for the difference in elevation:

Since the elevation at point B is 0.50 m higher, the vertical difference affects the horizontal distance calculation.

Step 3: Calculate the horizontal distance (D):

Using the principle that the line of sight is inclined, the horizontal distance can be estimated using the formula:

$$\backslash$$

$$D = \frac{\text{Staff difference}}{\tan \theta}$$

$$\backslash$$

However, without angle measurement, a simplified approach is to use the slope distance method or assume the line of sight is nearly horizontal, which is valid in small gradients.

Alternative method:

$$\backslash$$

$$D = \frac{\text{Staff difference}}{\cos \theta}$$

$$\backslash$$

But in practice, when the inclination is small, the horizontal distance is approximately equal to the staff difference, adjusted for the slope.

Result:

Assuming negligible slope, the horizontal distance is approximately 1.50 m. For more precise calculations, include the slope angle or use the Pythagorean theorem if the slant distance is known.

2. Determining Coordinates from a Traverse

Problem Statement

Given a closed traverse with the following details:

| Station | Forward Bearing | Distance (m) | Back Bearing |

|-----|-----|-----|-----|

| A to B | N 30° E | 200 | S 30° W |

| B to C | N 45° E | 150 | S 45° W |

| C to D | N 60° E | 180 | S 60° W |

| D to A | N 30° W | 200 | S 30° E |

Calculate the coordinates of points B, C, and D assuming point A is at (0,0).

Solution

Step 1: Convert bearings to azimuths.

- For N 30° E: azimuth = 0° + 30° = 30°
- For N 45° E: azimuth = 45°
- For N 60° E: azimuth = 60°
- For N 30° W: azimuth = 360° - 30° = 330°

Step 2: Compute coordinate differences using:

\

\Delta x = D \times \sin \theta

\

\

\Delta y = D \times \cos \theta

\]

Step 3: Calculate points B, C, D:

- From A (0,0):

- B:

\[

$$x_B = 0 + 200 \sin 30^\circ = 0 + 200 \times 0.5 = 100, \text{ m}$$

\]

\[

$$y_B = 0 + 200 \cos 30^\circ = 0 + 200 \times 0.866 = 173.2, \text{ m}$$

\]

- From B to C:

\[

$$x_C = x_B + 150 \sin 45^\circ = 100 + 150 \times 0.707 = 100 + 106.1 = 206.1, \text{ m}$$

\]

\[

$$y_C = y_B + 150 \cos 45^\circ = 173.2 + 150 \times 0.707 = 173.2 + 106.1 = 279.3, \text{ m}$$

\]

- From C to D:

\[

$$x_D = x_C + 180 \sin 60^\circ = 206.1 + 180 \times 0.866 = 206.1 + 155.9 = 362, \text{ m}$$

\]

\[

$$y_D = y_C + 180 \times \cos 60^\circ = 279.3 + 180 \times 0.5 = 279.3 + 90 = 369.3, \text{m}$$

\]

- From D to A (should close the traverse):

\[

$$x_{A'} = x_D + 200 \times \sin 330^\circ = 362 + 200 \times (-0.5) = 362 - 100 = 262, \text{m}$$

\]

\[

$$y_{A'} = y_D + 200 \times \cos 330^\circ = 369.3 + 200 \times 0.866 = 369.3 + 173.2 = 542.5, \text{m}$$

\]

Since the computed starting point (262, 542.5) does not match the initial point (0,0), adjustments are necessary to balance the traverse, such as applying correction methods like the Bowditch rule or least squares adjustment.

3. Reducing Traverses and Checking Closure Error

Problem Statement

A traverse with the following data:

Leg	Length (m)	Bearing
AB	300	N 45° E
BC	400	S 30° E

|-----|-----|-----|

| AB | 300 | N 45° E |

| BC | 400 | S 30° E |

| CD | 350 | S 60° W |

| DA | 250 | N 25° W |

Calculate the closure error and suggest methods to adjust the traverse.

Solution

Step 1: Convert bearings to azimuths.

- AB: 45°
- BC: 180° + 30° = 210° (since S 30° E)
- CD: 180° + 60° = 240° (S 60° W)
- DA: 360° - 25° = 335° (N 25° W)

Step 2: Compute the components:

- AB:

$$\Delta x_{AB} = 300 \times \sin 45^\circ = 300 \times 0.707 = 212.1, \text{ m}$$

]

[

$$\Delta y_{AB} = 300 \times \cos 45^\circ = 212.1, \text{ m}$$

]

- BC:

$$\Delta x_{BC} = 400 \times \sin 210^\circ = 400 \times (-0.5) = -200, \text{ m}$$

]

$$\backslash$$

$$\Delta y_{BC} = 400 \times \cos 210^\circ = 400 \times (-0.866) = -346.4, \text{ m}$$

$$\backslash$$

- CD:

$$\backslash$$

$$\Delta x_{CD} = 350 \times \sin 240^\circ = 350 \times (-0.866) = -303.1, \text{ m}$$

$$\backslash$$

$$\backslash$$

$$\Delta y_{CD} = 350 \times \cos 240^\circ = 350 \times (-0.5) = -175, \text{ m}$$

$$\backslash$$

- DA:

$$\backslash$$

$$\Delta x_{DA} = 250 \times \sin 335^\circ = 250 \times (-0.574) = -143.5, \text{ m}$$

$$\backslash$$

$$\backslash$$

$$\Delta y_{DA} =$$

Engineering Surveying Solved Problems with Answers: An Expert Overview

Engineering surveying is a fundamental discipline within civil engineering that involves the measurement and mapping of the Earth's surface to facilitate the planning, design, construction, and management of infrastructure projects. Its significance cannot be overstated, as accurate surveying data ensures the success and safety of projects ranging from roads and bridges to tunnels and dams. Over the years, engineering surveying has evolved from basic manual methods to

sophisticated technological solutions, enabling engineers to solve complex problems with precision and efficiency.

This article provides an in-depth exploration of common engineering surveying problems, their practical solutions, and detailed worked-out answers. Whether you're a student, a professional engineer, or a surveying enthusiast, understanding these solved problems helps reinforce core concepts and demonstrates best practices in the field.

Understanding the Core Principles of Engineering Surveying

Before delving into specific problems and solutions, it's essential to grasp the foundational principles that underpin engineering surveying. These include:

- Measurement of distances, angles, and elevations
- Reference to coordinate systems
- Use of various surveying instruments
- Application of mathematical and computational techniques

The accuracy of these measurements directly impacts the reliability of engineering designs. Common surveying methods include chain surveying, plane table surveying, theodolite surveying, tachometric surveying, and modern electronic methods like GPS and total stations.

Common Engineering Surveying Problems and Their Solutions

Below are some typical problems encountered in engineering surveying, along with comprehensive solutions and explanations.

Problem 1: Determining the Horizontal Distance Using Chain Surveying

Scenario:

A surveyor measures the distance between two points, A and B, using a steel chain. The measured length is 150 meters. However, the chain was slightly slack during measurement, causing the recorded length to be slightly longer than the actual distance. How can the actual horizontal distance be determined considering the chain's slack and stretch?

Given Data:

- Measured chain length (L_{measured}) = 150 m

- Chain slack correction factor = 0.02 m per 100 m of chain length (due to slack)
- Chain stretch correction (due to tension) = 0.01 m per 100 m of chain length

Solution Steps:

- Calculate the slack correction:

$$\text{Slack correction} = (0.02 \text{ m} / 100 \text{ m}) 150 \text{ m} = 0.03 \text{ m}$$

- Calculate the stretch correction:

$$\text{Stretch correction} = (0.01 \text{ m} / 100 \text{ m}) 150 \text{ m} = 0.015 \text{ m}$$

- Determine the corrected measured length:

$$\text{Corrected length (L}_{\text{corrected}}) = \text{L}_{\text{measured}} - \text{slack correction} + \text{stretch correction}$$

$$\text{L}_{\text{corrected}} = 150 \text{ m} - 0.03 \text{ m} + 0.015 \text{ m} = 149.985 \text{ m}$$

Final Answer:

The actual horizontal distance between points A and B is approximately 149.99 meters.

Problem 2: Calculating Elevation Difference Using Differential Leveling

Scenario:

Two points, P and Q, need their elevation difference determined. The back sight reading on point P is 2.345 m, and the foresight reading on point Q is 1.890 m. The height of the instrument (HI) is recorded at 100.000 m during the setup.

Question:

What is the elevation difference between points P and Q?

Solution:

- Calculate the elevation of point P:

Elevation of P = HI - Back sight reading

= 100.000 m - 2.345 m

= 97.655 m

- Calculate the elevation of point Q:

Elevation of Q = HI - Foresight reading

= 100.000 m - 1.890 m

= 98.110 m

- Determine the elevation difference (Q - P):

?H = Elevation of Q - Elevation of P

= 98.110 m - 97.655 m

= 0.455 m

Final Answer:

The elevation of point Q is 0.455 meters higher than point P.

Problem 3: Coordinate Computation Using Theodolite Traversing

Scenario:

A traverse is conducted to locate points A, B, and C. The initial station (A) has known coordinates (X_A = 5000 m, Y_A = 3000 m). The surveyor measures the following:

Line	Length (m)	Bearing (°)
------	------------	-------------

-----	-----	-----
-------	-------	-------

| A-B | 200 m | N 45° E |

| B-C | 150 m | S 30° W |

Calculate the coordinates of points B and C.

Solution:

- Convert bearings to azimuths:

- Bearing N 45° E corresponds to azimuth = 45°

- Bearing S 30° W corresponds to azimuth = 180° + 30° = 210°

- Compute coordinate changes for each line:

For each line,

$$\Delta X = L \cos(\text{azimuth})$$

$$\Delta Y = L \sin(\text{azimuth})$$

- A to B:

$$\text{Azimuth} = 45^\circ$$

$$\Delta X = 200 \cos(45^\circ) = 200 (0.7071) = 141.42 \text{ m}$$

$$\Delta Y = 200 \sin(45^\circ) = 200 (0.7071) = 141.42 \text{ m}$$

- B to C:

$$\text{Azimuth} = 210^\circ$$

$$\Delta X = 150 \cos(210^\circ) = 150 (-0.8660) = -129.90 \text{ m}$$

$$\Delta Y = 150 \sin(210^\circ) = 150 (-0.5) = -75 \text{ m}$$

- Calculate coordinates of B:

$$X_B = X_A + \Delta X = 5000 + 141.42 = 5141.42 \text{ m}$$

$$Y_B = Y_A + \Delta Y = 3000 + 141.42 = 3141.42 \text{ m}$$

- Calculate coordinates of C:

$$X_C = X_B + \Delta X = 5141.42 - 129.90 = 5011.52 \text{ m}$$

$$Y_C = Y_B - 75 = 3141.42 - 75 = 3066.42 \text{ m}$$

Final Coordinates:

- Point B: (5141.42 m, 3141.42 m)

- Point C: (5011.52 m, 3066.42 m)

Problem 4: Area Calculation Using Traversing Data

Scenario:

A closed traverse with the following coordinates is provided:

Point	X (m)	Y (m)
A	0	0
B	100	0
C	100	100
D	0	100

Calculate the area enclosed by the traverse.

Solution:

Using the surveyor's formula (also known as the shoelace formula):

$$\text{Area} = \frac{1}{2} |(X_A Y_B + X_B Y_C + X_C Y_D + X_D Y_A) - (Y_A X_B + Y_B X_C + Y_C X_D + Y_D X_A)|$$

Plugging in data:

$$= \frac{1}{2} |(00 + 100100 + 100100 + 00) - (0100 + 0100 + 1000 + 1000)|$$

$$= \frac{1}{2} |(0 + 10,000 + 10,000 + 0) - (0 + 0 + 0 + 0)|$$

$$= \frac{1}{2} |20,000 - 0| = 10,000 \text{ m}^2$$

Final Answer:

The area enclosed by the traverse is 10,000 square meters.
