Question What are common bacterial pathogens associated with urinary tract infections in clinical vignettes for USMLE Step 1 microbiology? Common bacterial pathogens include *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, and *Enterococcus* species. *E. coli* is the most frequent cause, often associated with pili-mediated adhesion and fimbriae. How does the Gram stain differentiate between types of bacteria commonly encountered in microbiology vignettes? Gram stain categorizes bacteria as Gram-positive (retaining the crystal violet stain, appearing purple) due to thick peptidoglycan layer, or Gram-negative (losing the crystal violet and taking up safranin, appearing pink) with a thinner peptidoglycan layer and an outer membrane. This distinction guides diagnosis and treatment. Which microbiological features are characteristic of *Mycobacterium tuberculosis* in clinical vignettes? *Mycobacterium tuberculosis* is an acid-fast bacillus with a waxy cell wall rich in mycolic acids, making it resistant to decolorization by acid alcohol during staining. It appears as rod-shaped, filamentous organisms on Ziehl-Neelsen stain and causes granulomatous inflammation. In microbiology vignettes, what is the significance of biofilm formation by bacteria such as *Pseudomonas aeruginosa*? Biofilm formation allows bacteria like *Pseudomonas aeruginosa* to adhere to surfaces and resist antibiotics and host immune responses, contributing to chronic infections such as in cystic fibrosis lungs or medical device-associated infections. What is the mechanism of action of penicillin in targeting bacteria in clinical vignettes, and which bacteria are typically susceptible? Penicillin inhibits bacterial cell wall synthesis by blocking transpeptidase enzymes (penicillin-binding proteins), leading to cell lysis. It is most effective against Gram-positive bacteria like *Streptococcus* spp. and some Gram-negative cocci such as *Neisseria gonorrhoeae*.
