This article will focus on solving representative questions in these areas to enhance understanding and exam readiness.

Sample Question 1: Maxima and Minima of Functions of Two Variables

Question:

Find the critical points and determine their nature for the function $f(x, y) = 3x^2 + 2xy + y^2 - 6x - 4y + 5$.

Answer:

Step 1: Find the first-order partial derivatives

$\frac{\partial f}{\partial x}$

$$= 6x + 2y - 6$$

$\frac{\partial f}{\partial y}$

$= 2x + 2y - 4$

$$= 2x + 2y - 4$$

$= 0$

Step 2: Set partial derivatives to zero to find critical points

$6x + 2y - 6 = 0$

$$6x + 2y - 6 = 0 \quad \dots(1)$$

$2x + 2y - 4 = 0$

\[

$$2x + 2y - 4 = 0 \quad \dots(2)$$

\]

Step 3: Solve the equations

From (2):

\[

$$2x + 2y = 4 \rightarrow x + y = 2 \rightarrow y = 2 - x$$

\]

Substitute into (1):

\[

$$6x + 2(2 - x) - 6 = 0$$

\]

\[

$$6x + 4 - 2x - 6 = 0$$

\]

\[

$$(6x - 2x) + (4 - 6) = 0$$

\]

\[

$$4x - 2 = 0$$

\]

\[

$$4x = 2 \Rightarrow x = \frac{1}{2}$$

\]

Now, find y:

\[

$$y = 2 - x = 2 - \frac{1}{2} = \frac{3}{2}$$

\]

Critical point: $(\frac{1}{2}, \frac{3}{2})$

Step 4: Second derivative test

Calculate second partial derivatives:

\[

$$f_{xx} = 6, \quad f_{yy} = 2, \quad f_{xy} = 2$$

\]

Determinant D:

\[

$$D = f_{xx} f_{yy} - (f_{xy})^2 = (6)(2) - (2)^2 = 12 - 4 = 8 > 0$$

\]

Since $(D > 0)$ and $(f_{xx} > 0)$, the critical point is a local minimum.

Sample Question 2: Solving a First-Order Differential Equation

Question:

Solve the differential equation:

[

$$\frac{dy}{dx} = \frac{x + y}{x}$$

]

given that $y(1) = 2$.

Answer:

Step 1: Rewrite the differential equation

[

$$\frac{dy}{dx} = 1 + \frac{y}{x}$$

]

This is a linear differential equation in the form:

[

$$\frac{dy}{dx} - \frac{1}{x} y = 1$$

]

Step 2: Find the integrating factor

[

$$\mu(x) = e^{-\int \frac{1}{x} dx} = e^{-\ln |x|} = \frac{1}{x}$$

]

Step 3: Multiply the entire equation by the integrating factor

[

$$\frac{1}{x} \frac{dy}{dx} - \frac{1}{x^2} y = \frac{1}{x}$$

]

Recognize the left as the derivative of $\left(\frac{y}{x}\right)$:

$\left[$

$$\frac{d}{dx} \left(\frac{y}{x} \right) = \frac{1}{x}$$

$\left]$

Sample Question 3: Evaluation of a Double Integral over a Region

Question:

Evaluate the double integral:

\\

$$\iint_{\{R\}} xy \, dA$$

\\

where $\{R\}$ is the region bounded by $\{x = 0\}$, $\{y = 0\}$, and $\{y = 4 - x\}$.

Answer:

Step 1: Describe the region $\{R\}$

- $\{x\}$ ranges from 0 to 4 (since $\{y = 4 - x\}$ intersects $\{x=0\}$ and $\{y=0\}$)
- For each $\{x\}$, $\{y\}$ ranges from 0 to $\{4 - x\}$

Step 2: Set up the double integral

$$\int_{x=0}^4 \int_{y=0}^{4-x} xy \, dy \, dx$$

\\

Step 3: Integrate with respect to $\{y\}$

\\

$$\int_0^4 \left[x \frac{y^2}{2} \right]_0^{4-x} dx = \int_0^4 x \frac{(4-x)^2}{2} dx$$

\\

Step 4: Simplify and integrate with respect to $\{x\}$

$$\int$$

$$\frac{1}{2} \int_0^4 x (4 - x)^2 dx$$

$$\int$$

Expand $(4 - x)^2 = 16 - 8x + x^2$:

$$\int$$

$$\frac{1}{2} \int_0^4 x (16 - 8x + x^2) dx$$

$$\int$$

Distribute:

$$\int$$

$$\frac{1}{2} \int_0^4 (16x - 8x^2 + x^3) dx$$

$$\int$$

Integrate term by term:

$$\int$$

$$\frac{1}{2} \left[8x^2 - \frac{8}{3} x^3 + \frac{1}{4} x^4 \right]_0^4$$

Understanding these topics provides the groundwork for solving complex problems that often appear in exams, project work, and practical scenarios. The focus of this article is to analyze a typical problem involving differential equations, a core component of Diploma Mathematics 2, illustrating the approach required to arrive at solutions systematically.

Sample Problem: Solving a Second-Order Differential Equation

Problem Statement

Solve the second-order linear differential equation:

[

$$\frac{d^2 y}{dx^2} - 3 \frac{dy}{dx} + 2 y = 0$$

]

with initial conditions:

[

$$y(0) = 4, \quad y'(0) = 0$$

]

Determine the general solution, apply the initial conditions, and find the particular solution.

Step-by-Step Solution Approach

1. Recognize the Type of Differential Equation

The given equation is a homogeneous linear second-order differential equation with constant coefficients:

$$\frac{d^2 y}{dx^2} - 3 \frac{dy}{dx} + 2 y = 0$$

The standard method for such equations involves solving the characteristic (auxiliary) equation derived from the differential equation.

2. Formulate the Characteristic Equation

Assume a solution of the form $y = e^{mx}$, where m is a constant to be determined. Substituting into the differential equation:

$$m^2 e^{mx} - 3 m e^{mx} + 2 e^{mx} = 0$$

Dividing through by e^{mx} (which is never zero):

$$m^2 - 3 m + 2 = 0$$

This quadratic equation is the characteristic equation.

3. Solve the Characteristic Equation

Solve:

\[

$$m^2 - 3m + 2 = 0$$

\]

Factor or use quadratic formula:

\[

$$(m - 1)(m - 2) = 0$$

\]

Thus,

\[

$$m_1 = 1, \quad m_2 = 2$$

\]

Since roots are real and distinct, the general solution of the differential equation is:

\[

$$y(x) = C_1 e^{m_1 x} + C_2 e^{m_2 x} = C_1 e^x + C_2 e^{2x}$$

\]

where (C_1) and (C_2) are constants to be determined.

4. Apply Initial Conditions to Find Constants

Given:

\[

$$y(0) = 4, \quad y'(0) = 0$$

\]

Compute $y(0)$:

[

$$y(0) = C_1 e^{\{0\}} + C_2 e^{\{0\}} = C_1 + C_2 = 4$$

\]

Next, compute $y'(x)$:

[

$$y'(x) = C_1 e^{\{x\}} + 2 C_2 e^{\{2x\}}$$

\]

Apply the initial condition $y'(0) = 0$:

[

$$C_1 e^{\{0\}} + 2 C_2 e^{\{0\}} = C_1 + 2 C_2 = 0$$

\]

Now, we have a system of two equations:

[

\begin{cases}

$$C_1 + C_2 = 4 \\\$$

$$C_1 + 2 C_2 = 0$$

\end{cases}

\]

Subtract the first from the second:

$$\backslash$$

$$(C_1 + 2 C_2) - (C_1 + C_2) = 0 - 4$$

$$\backslash$$

$$\backslash$$

$$C_2 = -4$$

$$\backslash$$

Substitute $(C_2 = -4)$ into the first equation:

$$\backslash$$

$$C_1 - 4 = 4 \rightarrow C_1 = 8$$

$$\backslash$$

5. Write the Particular Solution

Plugging the constants back into the general solution:

$$\backslash$$

$$\boxed{\phantom{y(x) = 8 e^{\{x\}} - 4 e^{\{2x\}}}}$$

$$y(x) = 8 e^{\{x\}} - 4 e^{\{2x\}}$$

$$\}$$

$$\backslash$$

This is the particular solution satisfying the initial conditions.

Analytical Insights and Significance

This example underscores several key principles in solving differential equations at the diploma level:

- Characteristic Equation Method: The cornerstone for solving linear differential equations with constant coefficients. Recognizing the form and deriving the characteristic equation simplifies the process.

- Initial Conditions Application: Essential for determining the arbitrary constants in the general solution, transforming it into a particular solution relevant to specific problems.

- Exponential Solutions: The roots of the characteristic equation directly inform the form of the solution, especially whether solutions involve exponentials, sines, cosines, or polynomials.

Understanding these principles is fundamental for students, as they frequently face such equations in engineering contexts?modeling systems, electrical circuits, mechanical vibrations, and thermal processes.

Extensions and Practical Relevance

While the solved question exemplifies a straightforward case, real-world problems often involve:

- Non-homogeneous differential equations with forcing functions.
- Variable coefficient equations requiring special functions.
- Systems of differential equations.
- Applications involving boundary and initial conditions reflecting physical constraints.

The method demonstrated here extends to these more complex scenarios, with modifications like the method of undetermined coefficients, variation of parameters, or Laplace transforms?techniques that are also covered in Diploma Mathematics 2.

In practical engineering, such solutions help analyze system behaviors, predict responses over time, and design control systems. For instance, mechanical oscillations modeled by second-order differential equations can be analyzed for stability, damping, and resonance?crucial in designing safe and efficient machinery.

Conclusion

The solved question on a second-order linear differential equation encapsulates the essential problem-solving approach in Diploma Mathematics 2. Through recognizing the type of equation, deriving the characteristic roots, and applying initial conditions, students can systematically arrive at solutions that are both mathematically rigorous and practically meaningful.

Understanding the Importance of Solved Questions in Diploma Mathematics

Solving previous years' questions and practicing with solved problems are vital strategies for success in diploma mathematics. They help students:

- Understand the exam pattern and marking scheme
- Identify common question types and topics
- Develop problem-solving skills and mathematical reasoning
- Build confidence in tackling challenging problems

A well-explained solved question not only clarifies concepts but also demonstrates how to approach similar problems efficiently during the actual exam. Now, let's delve into a typical problem encountered in Diploma Mathematics 1 and its detailed solution.

Sample Question: Calculus and Differential Equations

Question

A particle moves along a straight line such that its velocity $v(t)$ at time t seconds is given by:

$$[$$

$$v(t) = 3t^2 - 4t + 2$$

$$]$$

where $v(t)$ is in meters per second. Find:

- a) The displacement of the particle from $t = 0$ to $t = 4$ seconds.

b) The total distance traveled by the particle in this interval.

Step-by-Step Solution with Explanation

Part (a): Calculating Displacement

Displacement over an interval can be found by integrating the velocity function:

$$\text{Displacement} = \int_a^b v(t) \, dt$$

For t from 0 to 4 seconds:

$$\text{Displacement} = \int_0^4 (3t^2 - 4t + 2) \, dt$$

Step 1: Find the indefinite integral

$$\int (3t^2 - 4t + 2) \, dt = t^3 - 2t^2 + 2t + C$$

Step 2: Evaluate the definite integral

$$\left[t^3 - 2t^2 + 2t \right]_0^4$$

Plug in $t = 4$:

$$[$$

$$4^3 - 2 \times 4^2 + 2 \times 4 = 64 - 2 \times 16 + 8 = 64 - 32 + 8 = 40$$

]

Plug in $(t = 0)$:

[

$$0 - 0 + 0 = 0$$

]

Result:

[

$$\text{Displacement} = 40 \text{ meters}$$

]

Part (b): Calculating Total Distance Traveled

Total distance considers the direction changes; it is the integral of the absolute value of the velocity over the interval. Because velocity may change sign, we need to identify when $(v(t) = 0)$ within the interval, to split the integral accordingly.

Step 1: Find when $(v(t) = 0)$

[

$$3t^2 - 4t + 2 = 0$$

]

Solve the quadratic:

[

$$t = \frac{4 \pm \sqrt{(-4)^2 - 4 \times 3 \times 2}}{2 \times 3} = \frac{4 \pm \sqrt{16 - 24}}{6}$$

]

$$\sqrt{}$$

$$t = \frac{4 \pm \sqrt{-8}}{6}$$

$$\sqrt{}$$

Since the discriminant is negative, the quadratic has no real roots, meaning $v(t)$ does not change sign in the interval $[0, 4]$.

Step 2: Determine the sign of $v(t)$ in $[0, 4]$

Pick a test point, say $t = 1$:

$$\sqrt{}$$

$$v(1) = 3(1)^2 - 4(1) + 2 = 3 - 4 + 2 = 1 > 0$$

$$\sqrt{}$$

Since the velocity is positive at $t = 1$, and the quadratic has no real roots, the velocity remains positive throughout $[0, 4]$.

Step 3: Compute total distance

Because the velocity is positive over the entire interval:

$$\sqrt{}$$

$$\text{Total Distance} = \int_0^4 v(t) \, dt = 40 \text{ meters}$$

$$\sqrt{}$$

Note: If $v(t)$ had changed sign, we would need to split the integral at the roots and take absolute values accordingly.

Summary of the Solution

Part	Calculation	Result
1		

--	--	--

| (a) Displacement | $\int_0^4 (3t^2 - 4t + 2) dt$ | 40 meters |

| (b) Total Distance | Since $v(t) > 0$ in $[0, 4]$ | 40 meters |

Additional Tips for Students

- **Practice Integration Techniques:** Master basic integrals as they form the foundation for solving such problems.
- **Check Sign Changes:** Always verify whether the velocity function changes sign within the interval to determine whether you need to consider absolute values.
- **Understand the Concept of Displacement vs. Distance:** Displacement is the net change in position, while total distance accounts for actual path traveled, regardless of direction.
- **Use Graphical Methods:** Sketching the velocity graph can help visualize sign changes and the particle's motion.
- **Review Quadratic Roots:** Solving quadratic equations accurately is crucial for identifying points where velocity changes sign.

Conclusion

Practicing solved questions like this not only enhances understanding of calculus principles but also prepares students for similar problems in diploma examinations. Remember to carefully analyze the problem, apply the correct mathematical techniques, and verify each step for accuracy. With consistent practice and a clear understanding of concepts, success in diploma mathematics is well within reach.

- Boost Confidence: Seeing step-by-step solutions reduces anxiety and builds confidence to attempt similar questions independently.
- Exam Preparation: Practice with solved questions familiarizes students with exam patterns and question framing.

Typical Topics Covered in Diploma Mathematics 1

Diploma Mathematics 1 usually encompasses fundamental topics such as:

- Algebra
- Trigonometry
- Coordinate Geometry
- Calculus (Basics)
- Sequences and Series

For the purpose of this article, we will focus on a classic problem from the coordinate geometry section, which often appears in exams.

Sample Question: Solved Problem from Coordinate Geometry

Question:

Find the equation of the line passing through the points $A(2, 3)$ and $B(4, 7)$, and determine

whether the line is parallel or perpendicular to the line passing through points $(B(1, 2))$ and $(3, 5)$.

Step-by-Step Solution and Explanation

Step 1: Find the slope of the first line passing through points $(A(2, 3))$ and $(C(4, 7))$

The slope (m_1) of a line passing through two points (x_1, y_1) and (x_2, y_2) is given by:

[

$$m_1 = \frac{y_2 - y_1}{x_2 - x_1}$$

]

Substituting the values:

[

$$m_1 = \frac{7 - 3}{4 - 2} = \frac{4}{2} = 2$$

]

This indicates that the slope of the first line is 2.

Step 2: Find the slope of the second line passing through points $(B(1, 2))$ and $(D(3, 5))$

Similarly, the slope (m_2) :

[

$$m_2 = \frac{5 - 2}{3 - 1} = \frac{3}{2}$$

]

So, the slope of the second line is $(\frac{3}{2})$.

Step 3: Determine the relationship between the two lines

- Parallel lines have equal slopes: $(m_1 = m_2)$
- Perpendicular lines have slopes that are negative reciprocals: $(m_1 \times m_2 = -1)$

Calculating the product:

\[

$$m_1 \times m_2 = 2 \times \frac{3}{2} = 3$$

\]

Since the product is 3, which is neither 1 nor -1, the lines are neither parallel nor perpendicular.

Step 4: Find the equation of the first line passing through point $A(2, 3)$ with slope 2

Using the point-slope form:

\[

$$y - y_1 = m (x - x_1)$$

\]

Substituting:

\[

$$y - 3 = 2 (x - 2)$$

\]

Simplify:

\[

$$y - 3 = 2x - 4$$

\]

\[

$$y = 2x - 4 + 3$$

\]

$$\boxed{y = 2x - 1}$$

This is the equation of the line passing through points A and C .

Summarizing the Key Results

- The slope of the first line: 2
- The slope of the second line: $\frac{3}{2}$
- The lines are neither parallel nor perpendicular
- Equation of the first line: $y = 2x - 1$
